

## Isn't it Time

Throughout humanity's existence, we have evolved. Science helps us to understand for example why and how we get sick. Before we had scientific knowledge, people created fables and myths to explain what they could not understand without science. For example, the mythology of why spiders are such amazing spinners of web, although an imperfect explanation, was preferable to no explanation and the fear that often accompanies ignorance. While today we know so much more than we have ever known before, there is so much more to know. The Psyche asteroid allows us the opportunity to learn about our planet in an unorthodox manner. Humans have been deprived of direct observation of the Earth's core because our tools would melt from the heat. Psyche a former planet, allows direct observation because of a cooled core. Having been hit by space debris, Psyche remains 95% metal and a stunning example of the opportunity to extrapolate knowledge of the Earth's core based upon knowledge of Psyche.
